

Week 24: Deployment & Final Presentation

1. Deployment to Cloud (AWS EC2 / Render / Vercel + Atlas)

The completed project was deployed to cloud platforms such as AWS EC2, Render, or Vercel, while MongoDB Atlas was used for cloud database hosting. Deployment made the application publicly accessible and production-ready.

2. Environment Configuration

Environment variables and production configurations were set up to manage secure credentials, database connections, and server settings. Proper environment setup improved security and deployment flexibility.

3. Final Testing & Debugging

Before project submission, final testing was done to check functionality, responsiveness, security, and performance. Debugging fixed remaining issues and improved overall stability.

4. Project Presentation & Evaluation

The final project was presented with explanation of features, architecture, technologies used, and challenges solved. Evaluation focused on functionality, code quality, UI design, and full-stack integration.

Conclusion

This week focused on deployment and final project completion. By deploying the project, configuring environments, testing thoroughly, and presenting the final solution, a complete MERN stack development cycle was achieved.
